### SOCIAL DISTANCING, MONITORING, QUARANTINE OR ISOLATION? (COVID-19)

**ALL ARE USED TO CONTROL THE SPREAD OF COVID-19. HOW DO THEY DIFFER AND HOW LONG DO THEY LAST?**

</table>

| FOR HOW LONG? | Until the pandemic ends | Until 10 days after exposure, no symptoms and without testing OR until 7 days after exposure, no symptoms and with a negative test result occurring on day 6 or later.**** | At least 10 days since symptoms first appeared AND at least 24 hours with no fever without fever-reducing medications AND symptoms have improved |

### DEFINITIONS:

*Symptoms of COVID-19:* Range from mild to severe and may include fever (≥ 100.0°F) or chills, shortness of breath/difficulty breathing, fatigue, muscle/body aches, headache, new loss of taste or smell, sore throat, congestion or runny nose, nausea, vomiting.

**Close Contact:** Being within 6 feet of an infected person for a cumulative total of 15 minutes or more over a 24-hour period starting from 2 days before illness onset (or, for asymptomatic patients, 2 days prior to test specimen collection) until the time the patient is isolated.

***Symptoms that Suggest COVID-19 Worsening, Call Your Doctor or Go to ER:** Shortness of breath at rest, chest pain, persistently high fever despite fever lowering medicine, confusion, lightheadedness, inability to eat or drink.

**Social Distance:** Social distancing is a conscious effort to maintain distance between yourself and other people as a way to mitigate the spread of disease. This means avoiding public gatherings, bars, restaurants or other events, even if you are symptom free. Stay at least 6 feet from other people as often as possible. Take precautions if you cannot maintain that distance, such as using alcohol-based hand sanitizer and/or hand washing immediately after contact. Consider using curbside pick-up or delivery for essential items.

**Self-monitor:** People should monitor themselves for symptoms of COVID-19 by taking their temperatures twice a day and remaining alert for cough or difficulty breathing. If they feel feverish or develop measured fever, cough, or difficulty breathing during the self-monitoring period, they should self-isolate, limit contact with others and seek advice by telephone from a healthcare provider to determine whether medical evaluation is needed.

**Self-quarantine:** Separates people who were exposed but do not have symptoms to see if they become symptomatic. A person can be contagious before symptoms begin, so this is critical to prevent the spread.

**Self-isolation:** Separates people with symptoms of COVID-19, with or without a positive test. Stay home and away from others who share your residence to prevent the spread of the virus.

Note: Testing guidance is based on limited information and is subject to change as more information becomes available.
